Lab 6

Aim: Virtual Memory.

Objectives: This lab introduces simple tools available in Linux which helps in understanding some fundamental concepts related to disk utilisation using the concept of process management and virtual memory.

Part A

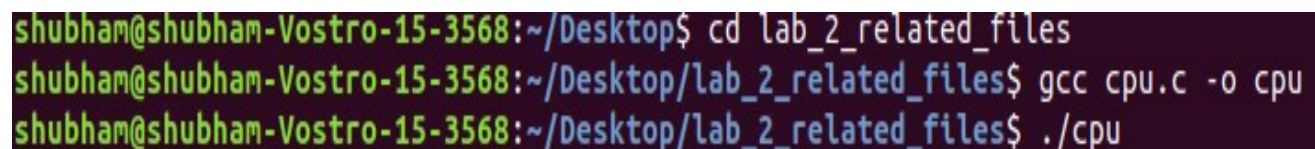

Code in cpu.c:

Below code contains a while loop and a for loop which assigns value to a variable repetatively.

```
#include <unistd.h>
#include <stdio.h>

int main(int argc, char *argv[])
{
    unsigned int i,j;
    while(1)
    {
        j = 1;
        for(i = 1; i <= 10; i++)
        {
            j = j*i;
        }
    }
}
```

Program compiling and execution:

```
shubham@shubham-Vostro-15-3568:~/Desktop$ cd lab_2_related_files
shubham@shubham-Vostro-15-3568:~/Desktop/lab_2_related_files$ gcc cpu.c -o cpu
shubham@shubham-Vostro-15-3568:~/Desktop/lab_2_related_files$ ./cpu
```

Top command execution in other terminal:

In below image you can see the process cpu running at the top.

```
top - 11:59:40 up 1:17, 1 user, load average: 2.83, 1.88, 1.58
Tasks: 264 total, 3 running, 211 sleeping, 0 stopped, 0 zombie
%Cpu(s): 50.4 us, 13.3 sy, 0.0 ni, 35.9 id, 0.4 wa, 0.0 hi, 0.0 si, 0.0 st
KiB Mem : 3899848 total, 318980 free, 3030972 used, 549896 buff/cache
KiB Swap: 2097148 total, 1613272 free, 483876 used. 274056 avail Mem
```

PID	USER	PR	NI	VIRT	RES	SHR	S	%CPU	%MEM	TIME+	COMMAND

6	root	0	-20	0	0	0	I	0.0	0.0	0:00.00	kworker/0:+

Questions:

1. What is the PID of the process running the cpu command?

Ans: In the above image you can see the process id (PID) of the cpu.c program execution in the first column which is 12800

2. How much CPU and memory does this process consume?

Ans: In the above image, in the %CPU column we can see the CPU consumption which is around 99.3% and in the %MEM we can see Memory consumption is around 0%.

3. What is the current state of the process? For example, is it running or in a blocked state ?

Ans: Current state of the process can be found out from the "S" column. For cpu process it is R which represents that process is in running state. Here S represents the sleeping and B represents blocked state.

Code in memory1.c :

In this program, we are creating array of size 1000000 but not accessing it. We are simply printing size of int and process id of this process.

```

#include <stdio.h>
#include <unistd.h>
#include <stdlib.h>

#define ARRAY_SIZE 1000000
int main()
{
    int array[ARRAY_SIZE];
    int i;

    printf("\n\nProgram : 'memory_1'\n");
    printf("_____\n");
    printf("\n\nPID : %d \n",getpid());
    printf( "Size of int : %ld \n",sizeof(int));

    printf("\nPress Enter Key to exit.\n");

    getchar();
    return 0;
}

```

Program compiling and execution:

```

shubham@shubham-Vostro-15-3568:~$ cd Desktop
shubham@shubham-Vostro-15-3568:~/Desktop$ cd lab_2_related_files
shubham@shubham-Vostro-15-3568:~/Desktop/lab_2_related_files$ gcc memory1.c -o memory1
shubham@shubham-Vostro-15-3568:~/Desktop/lab_2_related_files$ ./memory1

Program : 'memory_1'
-----

PID : 20298
Size of int : 4

Press Enter Key to exit.

```

Checking memory usage of memory1.c:

```

shubham@shubham-Vostro-15-3568: ~

```

Here to find the memory consumption of this process we are running program memory1.c in one terminal and running ps aux command in another terminal.

Here-

- The `a` option tells `ps` to display the processes of all users. Only the processes that not associated with a terminal and processes of group leaders are not shown.
- `u` stands for a user-oriented format that provides detailed information about the processes.
- The `x` option instructs `ps` to list the processes without a controlling terminal. Those are mainly processes that are started on boot time and running in the background.

So this can be used for determining different parameters of all the processes. All the columns shows following things:

- **USER** - The user who runs the process.
- **%CPU** - The cpu utilization of the process.
- **%MEM** - The percentage of the process's resident set size to the physical memory on the machine.

- **VSZ** - Virtual memory size of the process in KiB.
- **RSS** - The size of the physical memory that the process is using.
- **STAT** - The the process state code, such as Z (zombie), S (sleeping), and R (running).
- **START** - The time when the command started.

In the VSZ column, we can find out the V.M taken by memory1.c which is 8300KB. In the RSS column we can find out actual physical memory taken by process which is 796KB. Since we are just creating array , the physical memory consumed is less.

Code in memory2.c:

```
#include <stdio.h>
#include <unistd.h>
#include <stdlib.h>

#define ARRAY_SIZE 1000000

int main()
{
    int array[ARRAY_SIZE];
    int i;

    printf("\n\nProgram : 'memory_2'\n");
    printf("_____ \n");
    printf("\n\nPID : %d \n",getpid());
    printf("Size of int : %ld \n",sizeof(int));

    for(i=0;i<ARRAY_SIZE/2;i++)
    {
        array[i] = 10;
    }

    for(i=1;i<ARRAY_SIZE/2;i++)
    {
        array[i] = array[i-1]+25;
    }

    printf("\nPress Enter Key to exit.\n");

    getchar();
    return 0;
}
```

In this program, we are creating array of size 1000000. We are also assigning values to array also and we are also printing PID and size of int.

Program compiling and execution:

```
shubham@shubham-Vostro-15-3568:~/Desktop/lab_2_related_files$ gcc memory2.c -o memory2
shubham@shubham-Vostro-15-3568:~/Desktop/lab_2_related_files$ ./memory2

Program : 'memory_2'
-----

PID : 20467
Size of int : 4

Press Enter Key to exit.
```

Checking memory usage of memory2.c:

shubham@shubham-Vostro-15-3568: ~

In the VSZ column, we can find out the virtual memory taken by memory1.c which is 8300KB. In the RSS column we can find out actual physical memory taken by process which is 3212KB.

From this we can say that, memory1.c and memory2.c are using almost same virtual memory but memory2.c is using more physical memory than memory1.c. The reason for this is in memory1.c we are just creating array but in memory2.c we are creating array as well as we are assigning the values .

Part B

Code in disk.c and disk1.c and make copies shell script:

make copies shell script:

```
i=-1
while (( i++ < 5000 )); do
  cp ./disk-files/foo.pdf "/disk-files/foo$i.pdf"
done
```

disk.c

```
#include <unistd.h>
#include <stdio.h>
#include <sys/types.h>
#include <string.h>
#include <errno.h>
#include <stdlib.h>

#define FNAME_SIZE 100
#define MAX_FILE_NO 5000
#define BLOCK_SIZE 1024

int main(int argc, char *argv[])
{

  int n, file_no;
  FILE *fp;
  char dest_file_name[FNAME_SIZE];
  char buf[BLOCK_SIZE];

  while(1)
  {
    file_no = rand() % MAX_FILE_NO;

    bzero(dest_file_name, FNAME_SIZE);
    sprintf(dest_file_name, "disk-files/foo%d.pdf", file_no);

    fp = fopen(dest_file_name, "rb");
    if (fp == NULL) {
      perror("Can't open dest file");
      exit(1);
    }

    bzero(buf, BLOCK_SIZE);
    while ( (n = (int)fread( buf, 1, BLOCK_SIZE, fp )) > 0)
    {
      //do nothing with the read data;
      bzero(buf, BLOCK_SIZE);
    }
  }
}
```

```

    }

    fclose(fp);
}
}

```

disk1.c

```

#include <unistd.h>
#include <stdio.h>
#include <sys/types.h>
#include <string.h>
#include <errno.h>
#include <stdlib.h>

#define FNAME_SIZE 100
#define MAX_FILE_NO 10000
#define BLOCK_SIZE 1024

int main(int argc, char *argv[])
{

    int n, file_no;
    FILE *fp;
    char dest_file_name[FNAME_SIZE];
    char buf[BLOCK_SIZE];

    while(1)
    {
        //file_no = rand() % MAX_FILE_NO;
        file_no = 0;

        bzero(dest_file_name, FNAME_SIZE);
        sprintf(dest_file_name, "disk-files/foo%d.pdf", file_no);

        fp = fopen(dest_file_name, "rb");
        if (fp == NULL) {
            perror("Can't open dest file");
            exit(1);
        }

        bzero(buf, BLOCK_SIZE);
        while ( (n = (int)fread( buf, 1, BLOCK_SIZE, fp )) > 0)
        {
            //do nothing with the read data;
            bzero(buf, BLOCK_SIZE);
        }

        fclose(fp);
    }
}

```

}

After executing the make-copies.sh command:

Executing disk.c program:

```
shubham@shubham-Vostro-15-3568:~$ cd Desktop
shubham@shubham-Vostro-15-3568:~/Desktop$ cd lab_2_related_files
shubham@shubham-Vostro-15-3568:~/Desktop/lab_2_related_files$ ./make-copies.sh
shubham@shubham-Vostro-15-3568:~/Desktop/lab_2_related_files$ gcc disk.c -o disk
shubham@shubham-Vostro-15-3568:~/Desktop/lab_2_related_files$ ./disk
```

Using ps aux command:

Using the “ps” command to view the observed Process ID’ state, it gives the R and S states of the process where R means the running state and S means Sleeping state. The plus sign will indicate if the process is ran by the user in some terminal or in some GUI application i.e. in foreground.

```

root      433  0.0  0.0      0      0 ?      I<   10:41   0:00 [ath10k_aux_wq]

```

Using iostat command: The iostat command is used for monitoring system input/output device loading by observing the time the devices are active in relation to their average transfer rates. The iostat command generates reports that can be used to change system configuration to better balance the input/output load between physical disks.

```

```

Editing make-copies.sh from 5000 files to 100 files:

make copies shell script:

```

i=-1
while (( i++ < 100 )); do
  cp ./disk-files/foo.pdf "./disk-files/foo$i.pdf"
done

```

disk.c

```

#include <unistd.h>
#include <stdio.h>
#include <sys/types.h>
#include <string.h>
#include <errno.h>
#include <stdlib.h>

#define FNAME_SIZE 100
#define MAX_FILE_NO 100
#define BLOCK_SIZE 1024

int main(int argc, char *argv[])
{

  int n, file_no;
  FILE *fp;

```

```

char dest_file_name[FNAME_SIZE];
char buf[BLOCK_SIZE];

while(1)
{
    file_no = rand() % MAX_FILE_NO;

    bzero(dest_file_name, FNAME_SIZE);
    sprintf(dest_file_name, "disk-files/foo%d.pdf", file_no);

    fp = fopen(dest_file_name, "rb");
    if (fp == NULL) {
        perror("Can't open dest file");
        exit(1);
    }

    bzero(buf, BLOCK_SIZE);
    while ( (n = (int)fread( buf, 1, BLOCK_SIZE, fp )) > 0)
    {
        //do nothing with the read data;
        bzero(buf, BLOCK_SIZE);
    }

    fclose(fp);
}
}

```

After executing the make-copies.sh command:

```

shubham@shubham-Vostro-15-3568:~/Desktop/lab_2_related_files$ ./make-copies.sh
shubham@shubham-Vostro-15-3568:~/Desktop/lab_2_related_files$ █

```

After running this command we can see that 100 copies of foo.pdf are being made.

Executing disk.c program:

```
shubham@shubham-Vostro-15-3568:~/Desktop/lab_2_related_files$ ./make-copies.sh
shubham@shubham-Vostro-15-3568:~/Desktop/lab_2_related_files$ gcc disk.c -o disk
shubham@shubham-Vostro-15-3568:~/Desktop/lab_2_related_files$ ./disk
```

Using ps aux command:

```
shubham 19769 0.0 1.4 2588100 55728 tty2 Sl+ 13:46 0:01 /usr/lib/firefo

```

Thus we can see that in both the cases of 5000 copies and 100 copies V.M remains same and physical memory is slightly changing,

Conclusion:

- ✓ Thus in this experiment we have studied the analysis of process current execution state and analysis of busy IO operations that consume high CPU time.
- ✓ The processes are found to be in running state if they are continuously running without pausing and if they pause at the end then they enter the sleeping state.
